This certificate relates to the product models mentioned above. The data shown here is related to the following version of the China RoHS 2.0: Administrative Measures for the Restriction of Hazardous Substances in Electric Appliances and Electronic Products" released January 21st 2016.

部件名称	有害物质 - Hazardous Substances					
Part Name	铅 (Pb)	汞 (Hg)	镉 (Cd)	六价铬 (Cr (VI))	多溴联苯 (PBB)	多溴二苯醚 (PBDE)
金属部件 Metal parts	х	0	0	0	0	0
塑料部件 Plastic parts	0	0	0	0	0	0
电子件 Electronic	х	0	О	0	О	0
触点 Contacts	0	0	х	0	0	0
线缆和线缆附件 Cables & cabling accessories	0	0	О	0	0	0

本表格依据SJ/T11364的规定编制。

- O:表示该有害物质在该部件所有均质材料中的含量均在GB/T 26572规定的限量要求以下。
- X:表示该有害物质至少在该部件的某一均质材料中的含量超出GB/T 26572规定的限量要求。

This table is made according to SJ/T 11364.

O: indicates that the concentration of hazardous substance in all of the homogeneous materials for this part is below the limit as stipulated in GB/T 26572.

X: indicates that concentration of hazardous substance in at least one of the homogeneous materials used for this part is above the limit as stipulated in GB/T 26572

Signed (Kevin Shaw, R&D Director):

SAFETY NOTES

Warning: Any interruption of the protective conductor inside or outside the apparatus, or disconnection of the protective earth terminal is likely to make the apparatus dangerous under some fault conditions. Intentional interruption is prohibited.

Note: In order to comply with the requirements of safety standard BS EN61010-1, the instrument shall have one of the following as a disconnecting device, fitted within easy reach of the operator, and labelled as the disconnecting device.

- (a) A switch or circuit breaker which complies with the requirements of IEC947-1 and IEC947-3
- (b) A separable coupler which can be disconnected without the use of a tool.
- (c) A separable plug, without a locking device, to mate with a socket outlet in the building.

Note: Under extreme shock along the axis of the backplane, the E+PLC400 controller module is liable to reset. Following this reset, the behaviour of the instrument depends on the Watchdog Retry configuration switch on the terminal unit (section 2.3.1), which controls whether the instrument is allowed to reboot.

- Before any other connection is made, the protective earth terminal shall be connected to a protective conductor.
 The mains (supply voltage) wiring to the PSU must be terminated in such a way that, should it slip, the earth wire would be the last wire to become disconnected.
- 2. The protective earth terminal must remain connected (even if the equipment is isolated from the mains supply), if any of the I/O circuits are connected to hazardous voltages¹.
- 3. Fuses are not user replaceable. If it is suspected that the fuse is faulty, the manufacturer's local service centre should be contacted for advice.
- 4. Whenever it is likely that protection has been impaired, the unit shall be made inoperative, and secured against accidental operation. The manufacturer's nearest service centre should be contacted for advice.
- 5. Any adjustment, maintenance and repair of the opened apparatus under voltage, should be avoided as far as possible and, if inevitable, shall be carried out only by a skilled person who is aware of the hazard involved.
- 6. Where conductive pollution (e.g. condensation, carbon dust) is likely, adequate air conditioning/filtering/sealing etc. must be installed in the E+PLC400 enclosure.
- 7. If the equipment is used in a manner not specified by the manufacturer, the protection provided by the equipment might be impaired.
- 8. In order to comply with the requirements of BS EN61010-1 the voltage applied across I/O terminals may not exceed the isolation voltage for those terminals. For terminals specified as having 'no isolation', the maximum permissible voltage is 30V ac or 60V dc.
- 9. Over temperature protection: A separate over-temperature protection unit (with an independent temperature sensor) should be fitted to isolate any process heating circuit should a fault condition arise.

 Alarm relays within the instrument do not give protection under all fault conditions.
- 10. The designer of any control scheme must consider the potential failure modes of control paths and, for certain critical control functions, provide a means to achieve a safe state during and after a path failure.
- 11. Separate or redundant control paths must be provided for critical control functions.

^{1.} A full definition of 'Hazardous' voltages appears under 'Hazardous live' in BS EN61010-1. Briefly, under normal operating conditions, hazardous voltages are defined as being > 42.2V peak ac (30V RMS) or > 60V dc

- 12. System control paths may include communication links. Consideration must be given to the implications of unanticipated transmission delays or failures of the link.
- 13.Each implementation of this equipment must be individually and thoroughly tested for proper operation before being placed into service.

I/O ISOLATION STRATEGY

Isolation is implemented in the form of a double insulation (300V) barrier separating all the I/O channels in a module from the rest of the system. This prevents hazardous voltages on any one I/O channel from introducing hazards on wiring associated with any other I/O module, or from putting the rest of the system at risk.

Modules which provide channel-to-channel isolation further ensure safety and good signal quality on all channels within such modules. Refer to the relevant section of Appendix A: for more details.

EMC

This instrument conforms with the essential protection requirements of the EMC Directive 2004/108/EC. It also satisfies the emissions and immunity standards for industrial environments.

To ensure compliance with the European EMC directive certain installation precautions are necessary:

- **Relay outputs**: When using relay outputs it may be necessary to fit a filter suitable for suppressing conducted emissions. The filter requirements will depend on the type of load.
- Routing of wires: To minimise the pick-up of electrical noise, low voltage DC connections and sensor input wiring should be routed away from high-current power cables. Where it is impractical to do this, shielded cables should be used.
- Power supply: The instrument must be powered from a local power supply and must not be connected to a DC distribution network. The power supply must be earthed according to manufacturers instructions in order to give best EMC performance for the system.

SYMBOLS USED ON THE INSTRUMENT LABELLING

One or more of the symbols below may appear either as a part of the labelling of the items comprising this instrument. In some cases, symbols may be incorporated in the moulding or stamped on the metalwork.

Symbol	Meaning
<u> </u>	Refer to the user guide for instructions.
4	Protective earth ground conductor terminal.
	Precautions against electrostatic discharge must be taken before handling this unit or any electronic component of it.
R	Complies with the RoHS2 (2011/65/EU) directive.
40)	For environmental reasons, this product must be recycled before its age exceeds the number of years shown in the circle.
CUL US LISTED E57766	Underwriters Laboratories listed mark for the United States and Canada.
CE	This unit is CE compliant.
&	RCM. R egulatory C ompliance M ark for Australia and New Zealand.
A	Risk of electric shock.

Table 1: Symbols used on the E+PLC400

1 INTRODUCTION

This document describes the installation and configuration of the E+PLC400 hardware components. The instrument supports up to 16 I/O modules (according to backplane size) and is equipped for secure archiving via FTP transfer and/or to USB memory stick.

Associated documents

- HA031793 E+PLC400 Installation & Wiring Instructions sheet
- IA029470U812 Declaration of conformity

Online help is also available within the CODESYS software, see Section 3

1.1 PHYSICAL STRUCTURE

The E+PLC400 hardware consists of a Controller module and up to 16 Input/Output (I/O) Modules each of which clips into its own individual terminal unit which provides termination for user wiring. The terminal units themselves are located in a backplane which is mounted on a DIN rail or on a panel, as required. Backplanes are available in different sizes to accommodate different numbers of I/O Modules: with 16, 8, 4 or 0 slots (the latter accommodating a Controller module only).

The lower front of the unit is covered by a removable flap which protects the wiring, but leaves the status LED open to view.

Live replacement of a failed control module can be carried out, without wiring disconnections. Full hardware and software status indication allows rapid verification and diagnostics.

Automatic health checks, self-testing, and initialisation are carried out at power-up. I/O status and external communications are checked continuously and LEDs are provided on all modules to indicate communications and module I/O status.

1.2 AVAILABLE I/O MODULES

Al2	Two isolated universal analogue input channels. Terminal unit variants are available for particular applications (thermocouple inputs, resistance thermometer inputs, voltage or current measurement).
Al3	Three analogue input channels used for current loops, either self powered or externally powered.
Al4	Two pairs of isolated analogue input channels. Terminal unit variants are available for particular applications (thermocouples, mA or mV inputs).
Al8	High density analogue input module. Terminal unit variants are available for eight channels of mA inputs (fast or standard polling), eight channels of thermocouples with cold junction compensation (also accepts mV inputs), or four channels for platinum resistance thermometers (RTD).
AO2	Two analogue output channels supplying 0 to 20 mA or 0 to 10 V signals.
DI6	Six channel digital input module. Supplied in 115V or 230V a.c. mains input variants.
DI16	16 digital input channels (universal inputs).
DO16	16 digital output channels.
RLY8	Eight relays (normally open).
ZI	Zirconia probe input.

1.3 POWER SUPPLY

Power is applied to terminals mounted on the controller module, as shown in section 2.3.1. The system monitors the supply voltage allowing an alarms to be triggered should the supply voltage drop below an acceptable value.

2 INSTALLATION

2.1 UNPACKING THE INSTRUMENT

The instrument is despatched in a special pack, designed to give adequate protection during transit. Should the outer box show signs of damage, it should be opened immediately, and the contents examined. If there is evidence of damage, the instrument should not be operated and the local representative contacted for instructions. After the instrument has been removed from its packing, the packing should be examined to ensure that all accessories and documentation have been removed. The packing should then be stored against future transport requirements.

2.2 MECHANICAL INSTALLATION

Figure 1 and Table 2 give dimensional details for the E+PLC400; Figure 2 gives fixing details. Figure 3 shows details for instruments with a zero-module backplane.

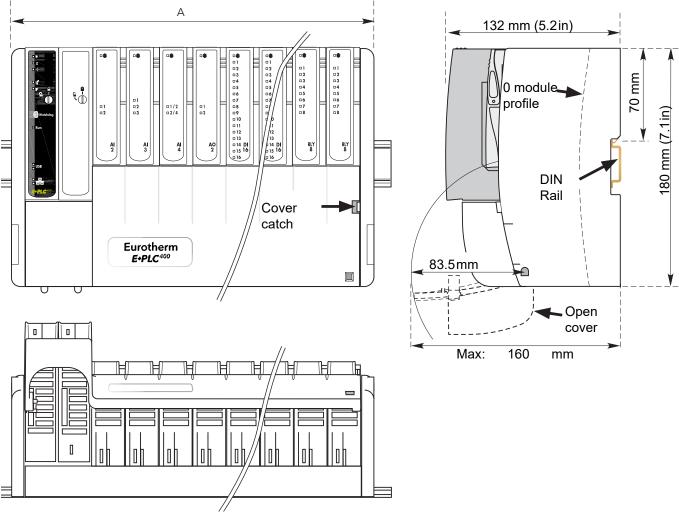

Figure 1: Overall dimensions

Backplane size	Length of 'A' (figure 1)		
Buckplane 3120	mm	in	
0 module	71.0	2.8	
4 module	172.5	6.8	
8 module	274.0	10.8	
16 module	477.0	18.8	

Table 2: E+PLC400 backplane dimensions

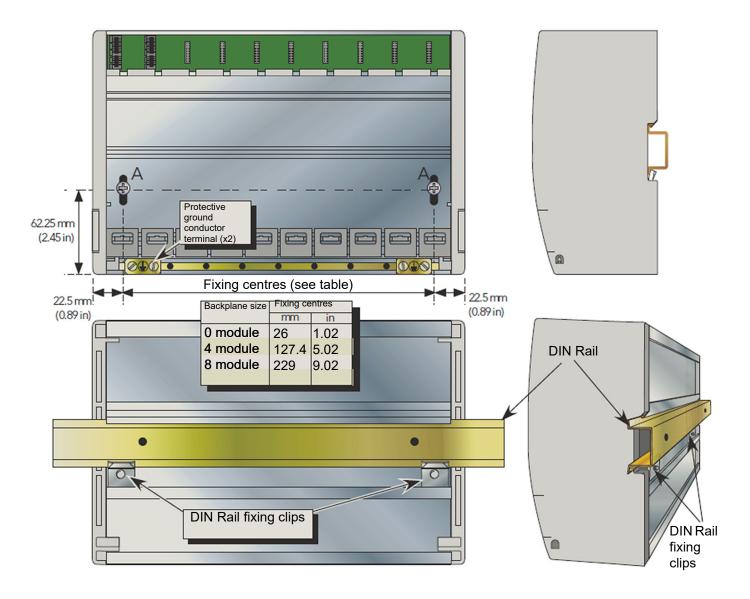

Figure 2: Fixing details (including protective ground conductor connections)

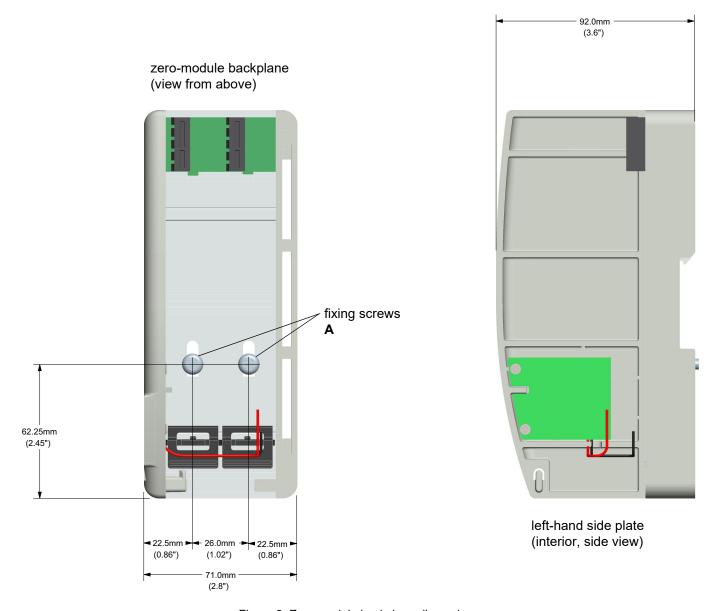

Figure 3: Zero-module backplane dimensions

For 0-module backplanes, the instrument is supplied without the right-hand plastic side plate fitted. The side plate is included in the packaging and can be fitted if desired.

2.2.1 Backplane mounting

This backplane is intended for DIN rail or bulkhead mounting within an enclosure.

Warning: The equipment should not be operated without a protective earth conductor connected to one of the earth terminals on the backplane. The earth cable should have at least the current rating of the largest power cable used to connect to the instrument

The protective earth cable should be terminated with a suitable tinned copper eyelet, retained by one of the screw and washer supplied with the base unit, tightened to a torque of 1.2 Nm (10.5 lb in).

This connection also provides a ground for EMC purposes.

DIN Rail Mounting

For DIN rail mounting, symmetrical, horizontally-mounted 35×7.5mm or 35×15mm DIN rail to BS EN50022 should be used.

- 1. Mount the DIN rail, using suitable bolts, ensuring that it makes good electrical contact with the enclosure metal work either *via* the bolts or by means of a suitable earthing cable.
- 2. Loosen the screws ('A' in Figure 2 and Figure 3) in the backplane, two or three turns, and allow them, and the associated fixing clips to slide to the bottom of the screw slot.
- 3. Lower the backplane on to the DIN rail such that the top edge of the rail fits into the slot on the underside of the support bar (see Figure 2 and Figure 3).
- 4. Slide the screws (A) and associated clips as far as they will go towards the top of the screw slots, ensuring that the top of each fixing clip locates behind the bottom edge of the DIN rail.
- 5. Tighten the screws, and check that the base unit is fully secure on the rail.

Panel Mounting

Warning: Bolt heads must not exceed 5mm in height, or there will be insufficient isolation clearance between the bolt head and the relevant terminal unit(s).

- 1. Remove the screws ('A' in Figure 2 and Figure 3) and associated fixing clips.
- 2. Holding the base unit horizontally on the panel, mark the position of the two holes on the panel.
- Drill two suitable holes in the panel, and use two suitable bolts (M5 recommended) to secure the backplane to the
 panel, ensuring that good electrical contact with the enclosure metal work is made either *via* the bolts or by
 means of a suitable earthing cable.

2.2.2 Terminal unit installation

- 1. Insert the tag at the top of the terminal unit printed circuit board into the relevant slot in backplane (action 'B' in Figure 4).
- 2. Press on the bottom of the terminal unit until a 'click' confirms that the retention clip has sprung back into position to secure the terminal unit (action 'C' in Figure 4)..

Caution: Ensure that the correct terminal unit is used for the type of I/O Module being fitted. In particular, fitting an Al2 module to an Al4 terminal unit, or vice-versa, causes unexpected behaviour which may damage the process being controlled.

Note: If the backplane is not fully populated a blank terminal unit (supplied) must be fitted immediately to the right of the final module position in order to maintain IP20 rating.

Terminal Unit Removal

- 1. Remove the terminal unit's I/O module, if fitted (section 2.2.3, below).
- 2. If necessary, remove all wiring from the terminal unit.
- 3. Press the retention clip at the bottom of the terminal unit and lift the terminal unit out (action 'D' in Figure 4).

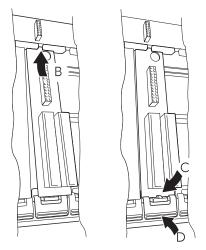

Figure 4: Terminal unit installation/removal

2.2.3 Module Installation

Controller Module

The controller module (Figure) is installed in the left-most slot only.

A blank case is fitted in the adjacent slot—this slot is not intended for controller module use.

To install an controller module:

- 1. Use a 3mm flat-blade screwdriver to ensure that the securing bolt is rotated anticlockwise (counter clockwise) to the unlocked position.
- 2. Offer the module up to the terminal unit and the backplane, and push home.
- 3. Use a 3mm flat-blade screwdriver to rotate the securing bolt 90° clockwise to the locked position.

To remove an controller module:

- 1. Use a 3mm flat-blade screwdriver to rotate the securing bolt 90° anti-clockwise (counter clockwise) to the unlocked position.
- 2. Disengage the module and lift it out of the base unit.

nd push home.

90° clockwise to the

90° anti-clockwise

Figure 5: Controller module installation

Locked.

Note: Whilst the I/O cover flap on 4/8/16-way units may be removed to ease access to terminal units, the side pieces must be left in place to provide support and to guide insertion.

I/O Modules

- 1. Pull the module retaining lever forwards into the unlocked position as shown in Figure 6.
- 2. Offer the module up to the terminal unit and the backplane, and push home.
- 3. Return the retaining lever to the locked position..

Caution: Ensure that the correct terminal unit is used for the type of I/O Module being fitted. In particular, fitting an Al2 module to an Al4 terminal unit, or vice-versa, causes unexpected behaviour which may damage the process being controlled.

2.2.4 Module Removal

- 1. Pull the module retaining lever forwards into the unlocked position as shown in Figure 6.
- 2. Disengage the module from the backplane connector and lift the module out of the base unit.

Figure 6: I/O Module installation

2.2.5 Module identification

The inside of the cover contains locations ('slots') for labels which can be used to identify the module fitted 'above' each slot.

A document template is supplied on DVD-ROM which allows the user to print onto a precut adhesive sheet (GA030486, supplied with the instrument). Once printed, the relevant labels can be peeled-off the backing sheet and attached to the relevant slots.

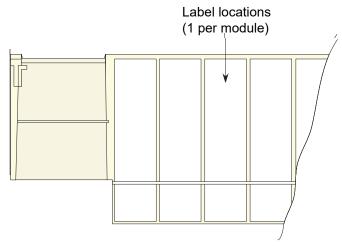

Figure 7: Inside cover

2.3 ELECTRICAL INSTALLATION

2.3.1 Controller module terminal unit

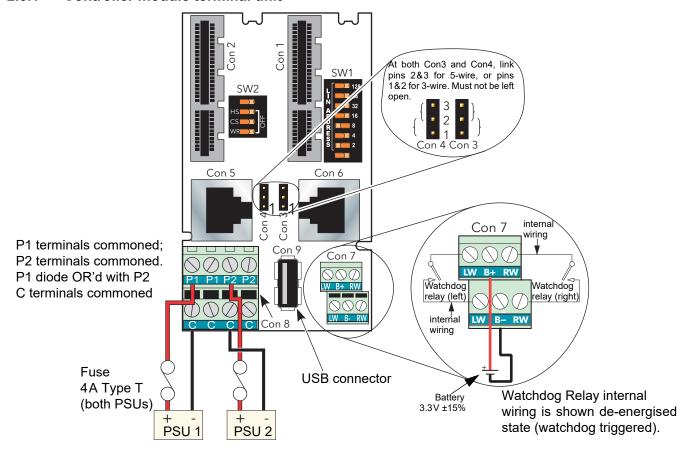

Figure 8: Controller module terminal unit wiring; watchdog relay terminals

Supply Wiring

Figure 8 shows the control module terminal unit with wiring details for the supply and for the battery. The instrument supply voltage is 24Vdc ± 20%.

Typical power requirement is 150mA (3.6W) for the controller module, plus 0.5A (12W) for a four-module unit, 1 amp (24W) for an eight-module unit or 2 amps (48W) for a 16-module unit.

Caution: Do not allow the supply line to rise above 30 volts with respect to protective earth ground conductor.

Note: Should the supply voltage fall below 19.2V during startup, the instrument will not start successfully and will attempt repeatedly to restart.

Fuses

The positive supply line must incorporate a fuse. A suitable type is a 4 amp Type T.

Wire Sizes

Supply wiring: 0.25 mm² to 2.5 mm² (20 AWG to 14 AWG)

Note: The above diameters relate to the total cross sectional area of the conductor(s) inserted into the terminal.

Terminal Details

Recommended screwdriver type for supply power connector: 3mm flat blade.

Maximum tightening torque: 0.6Nm.

Maximum current carrying capability: 5A per pin.

Caution: The maximum current carrying capacity should be considered when 'daisy chaining'.

Protective earth ground conductor

Figure 2 and associated text, above, gives protective earth ground conductor details.

Communications Connector

A pair of parallel-wired RJ45 connectors are used for EIA485 serial communications. Figure 9 and Table 3 give the pinout.

Pin	5-wire Master	5-wire Slave	3-wire Master/ Slave
1	RxB	TxB	В
2	RxA	TxA	Α
3	Common	Common	Common
4	Not Connected	Not Connected	Not Connected
5	Not Connected	Not Connected	Not Connected
6	Common	Common	Common
7	TxB	RxB	Not Connected
8	TxA	RxA	Not Connected

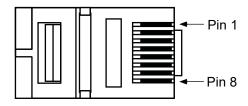

Table 3: Controller module comms pinout (EIA485)

Figure 9: RJ45 plug (view on underside)

Warning: If the screen is earthed at both ends, it must be ensured that the earth potentials at the ends of the cable are equal. If such is not the case, very large currents can flow through the screen, causing the cable to become hot enough to harm personnel who come into contact with it, and/or to cause fire.

Note: The screen of the cable is connected to earth via the RJ45 connectors. Best RFI performance is achieved if the screen is also earthed at its other end, but see the Warning below.

USB Connector

A single Type-A USB connector, for USB 2.0 host communications, is located on the controller module terminal unit as shown in Figure 8.

The connector is intended for use with USB memory sticks, and can supply up to 500 mA. Any attempt to draw more than 500 mA will cause the current limiting circuitry to shut the USB power down.

The controller module contains a USB fuse which prevents the entire supply power system from being affected in the unlikely event of a catastrophic failure in the USB electronics. The fuse is not user replaceable, so if it fails, the module must be returned to the supplier for service.

CODESYS applications can access the USB port via the path '/usb0'.

2.3.2 Hardware Watchdog & Watchdog Relay

The Controller module incorporates a hardware 'watchdog' function which will trigger if system health checks fail. If the hardware watchdog triggers then:

- All I/O channels on the E+PLC400's I/O modules are forced into their power off state.
- The Controller module's processor is forced into the reset state—any running application is terminated.
- The watchdog relay is de-energised (contacts open)—see below.
- The red Fault Indicator LED on the Controller module (see section 2.3.3) will flash for 10 seconds.

Recovery from a hardware watchdog trigger

· Default behaviour: Automatic restart

With standard factory default settings, if the hardware watchdog triggers, the red Fault Indicator LED will begin to flash, and the E+PLC400 will automatically attempt to restart within 10 seconds.

If the restart is successful, the red Fault Indicator LED will go out. If the E+PLC400 was running a boot application, then this should restart too.

Manual restart

It is possible to change the default restart behaviour following a hardware watchdog trigger. To change the restart behaviour, set the 'watchdog retry' switch on the Controller module terminal unit to the 'OFF'. (The switch is labelled **WR** in the **SW2** block—see Figure 8).

With the WR switch in the OFF position, the E+PLC400 will not automatically restart following a hardware watchdog trigger. The red Fault Indicator LED will remain on continuously.

In this circumstance, you can manually restart the E+PLC400 by pressing the recessed Watchdog button on the Controller module (see section 2.3.3). If the manual restart is successful, the red Fault Indicator LED will go out.

Watchdog Relay

The hardware watchdog controls a relay on the Controller module, which is accessible via the **LW** and **RW** terminals on **Con7** (see Figure 8). Typically, you can use these to connect additional hardware to the E+PLC400 that will provide appropriate interlock behaviour in the event of the watchdog triggering. The contact ratings (resistive loads) for the watchdog relays are 30Vac / 60Vdc at 0.5A.

Note: If the watchdog relay outputs are routed outside the cabinet in which the E+PLC400 is mounted, a clip-on ferrite should be fitted round all watchdog leads, and positioned as closely as possible to the instrument. A suitable ferrite is available from Eurotherm, part number CO025698.

The watchdog relay behaves as set out in Table 4.

Condition	Resulting Watchdog Relay state
An application is running	Relay energised (contacts closed)
If any of the following apply: —The E+PLC400 is powered off. —During initial power up (until system health checks are completed). —An application is terminated. —The processor enters the reset state. —A signal to open the relay is received from the application (for more details, refer to the E+PLC400 Online Help—see section 3.1)	Relay de-energised (contacts open)

Table 4: Switching conditions for the Watchdog Relay

2.3.3 Controller module status indicators

Figure 10 shows the controller module front panel, with status LEDs. Details are listed in Table 5.

Figure 10: Controller module LEDs

Icon	Name	LED Colour	Meaning
*	Power status	green	On: Main power input valid Off: Main power input failed
x	Fault indicator	red	On: Module missing or faulty Flashing: Hardware watchdog has triggered (see section 2.3.2). Off: No hardware faults detected
土	Battery status	green	On: Battery OK Flashing: battery failed or not fitted
C	Serial Comms status	green	On: serial communications are being transmitted Off: no active serial communications
IP	Ethernet IP status	green	On: E+PLC400 online with at least one CIP connection Flashing: E+PLC400 online but with no CIP connections Off: E+PLC400 is initialising communications or a connection has timed out
Watchdog	Watch- dog reset button	none	Recessed button. If the red Fault Indicator LED is On solidly, pressing this button will initiate a system restart (see section 2.3.2).
Run	PLC program run status	green	Off: E+PLC400 firmware has not yet booted up. (Booting should normally complete within 30 seconds). Flashing: E+PLC400 has booted up and is ready to run programs. On: A program is currently running (initiated from the Online menu in the CODESYS software)
USB	USB software	green	On: USB device powered. Flashing: USB device being accessed. The USB device must not be removed. Off: USB device not powered and may be removed.
	USB hardware	yellow	On: an attempt is being made to draw too much current (> 500 mA) from the USB socket. USB activity suspended. Off: No hardware failure reported.
<u> </u>	Ethernet speed	green	On: 100 MB Off: 10 MB
	Ethernet activity	yellow	On: Connected to a live Ethernet network Flickering; Network traffic detected Off: Ethernet connection invalid

Table 5: Controller module LEDs

2.3.4 Two-channel analogue input (Al2)

This module can be ordered with terminal unit variants to measure thermocouple inputs (Al2-TC), voltage or resistance thermometer inputs (Al2-DC), or current (Al2-MA). Figure 11 gives pinout details.

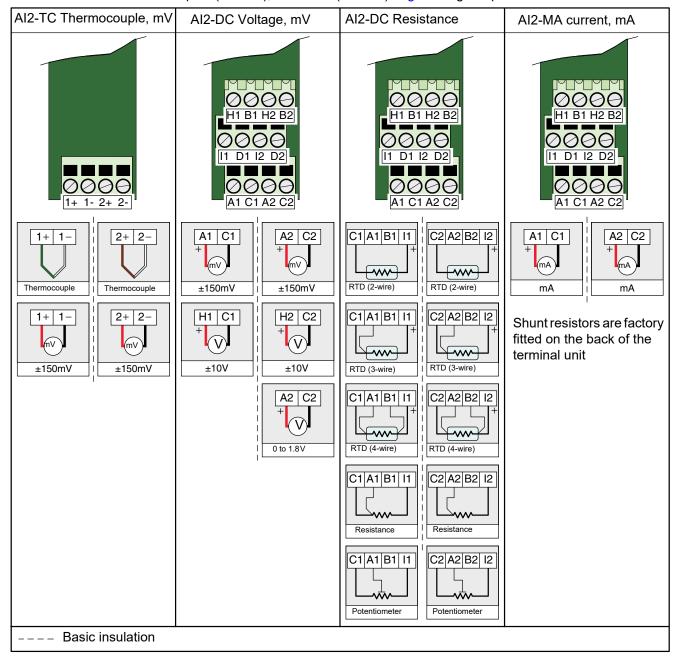

Figure 11: Al2 module pinout

Note: The module terminals accept wire sizes from 0.20 to 2.5mm² (14 to 24AWG). The screws should be tightened to 0.4Nm (5.3lbin) using a 3.5mm flat blade screwdriver.

Status Indicators

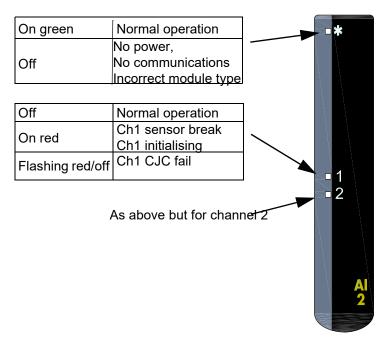

Figure 12: Al2 Status indicators

Note: Flashing = 0.5s on, 0.5s off.

2.3.5 Three-channel analogue input (AI3)

This module provides three isolated mA input channels. An isolated 24V (nominal) supply is available across the 'P' and 'C' terminals for powering the current loop. If the current loop is self powered, the 'C' and 'I' terminals should be used. Figure 13 shows the pinout.

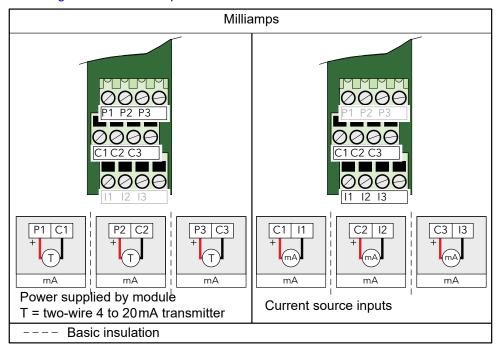

Figure 13: Al3 module pinout

Status Indicators

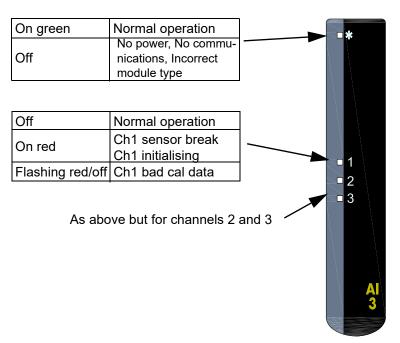

Figure 14: Al3 Status indicators

Note: The module terminals accept wire sizes from 0.20 to 2.5 mm² (14 to 24 AWG). The screws should be tightened to 0.4 Nm (5.3 lbin) using a 3.5 mm flat blade screwdriver.

Note: Flashing = 0.5s on, 0.5s off.

HART Compatibility

For each channel a 195Ω resistor is fitted in the input circuitry to the amplifier. Normally, these resistors are bypassed by printed circuit links on the underside of the terminal unit. In order to make the module HART compatible, these links can be cut, placing the resistors in series with the amplifier inputs.

Figure 15 shows the module equivalent circuit, and figure 16 shows the location of the links on the underside of the terminal unit.

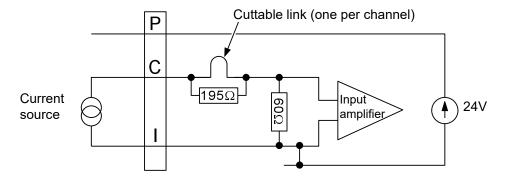

Figure 15: Al3 module equivalent circuit

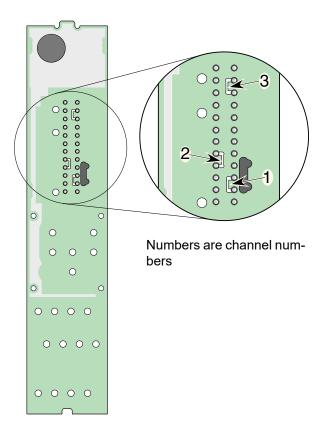

Figure 16: Link locations on underside of terminal unit

2.3.6 Four-channel analogue input (Al4)

This module is ordered with a particular terminal unit variant, to measure thermocouple, voltage or current inputs. Figure 17 gives pinout details.

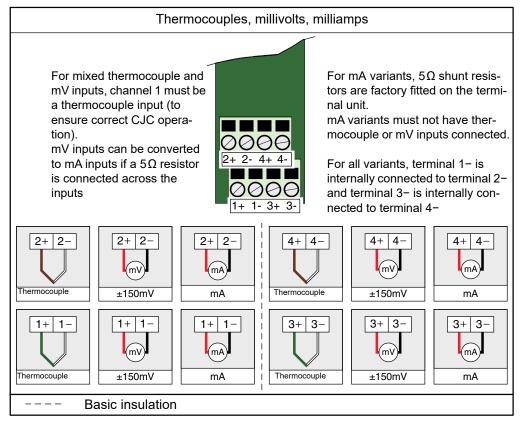

Figure 17: Al4 module pinout

Note: The module terminals accept wire sizes from 0.20 to 2.5 mm² (14 to 24 AWG). The screws should be tightened to 0.4 Nm (5.3 lbin) using a 3.5 mm flat blade screw-driver.

Status Indicators

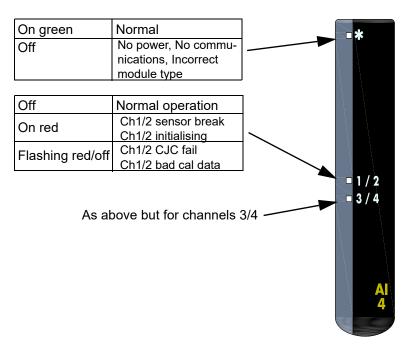

Figure 18: Al4 status indicators

Note: Flashing = 0.5s on, 0.5s off.

2.3.7 High density analogue input (Al8)

This module can be ordered as one of four variants (each of which has a different terminal unit):

• Al8-RT—four channels of isolated platinum resistance thermometer (RTD) inputs, standard polling rate. See Figure 19 for terminal pin-out details.

For the following three variants, the channels are isolated in pairs.

- Al8-MA or Al8-FMA—eight isolated channels of current (mA) inputs, standard polling rate and fast polling rate, respectively. See Figure 20 for terminal pin-out details.
- Al8-TC—eight channels of thermocouple inputs (with cold junction compensation) or voltage (mV) inputs, standard polling rate. See Figure 21 for terminal pin-out details.

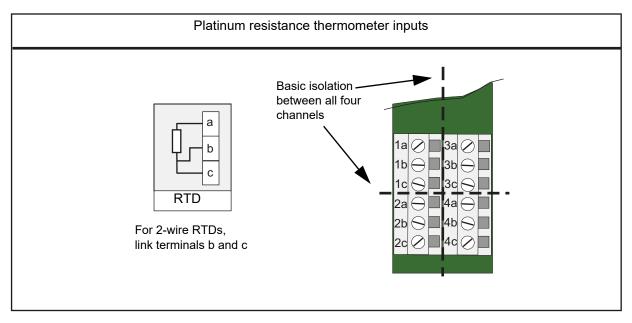

Figure 19: AI8-RT terminal unit

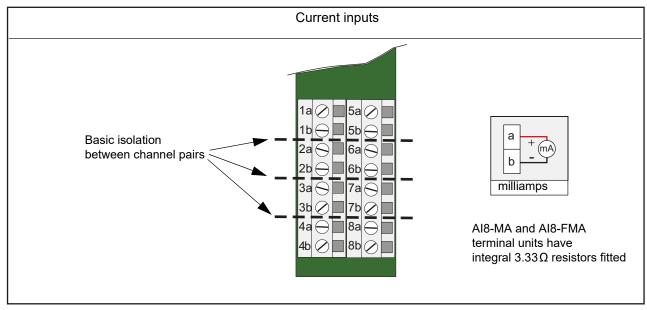

Figure 20: Al8-MA and Al8-FMA terminal units

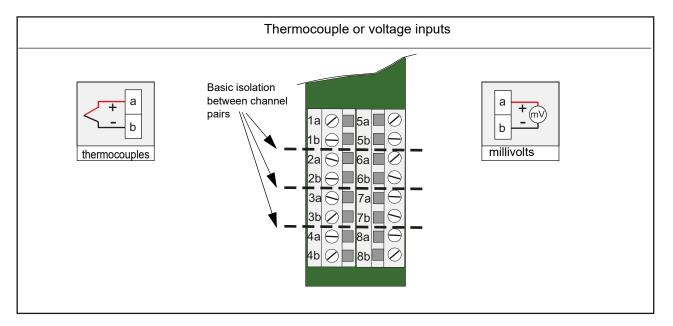

Figure 21: Al8-TC terminal units

Caution: For connections to the Al8-TC terminal unit, if thermocouple wiring needs to be extended, use the correct compensating cable and ensure that polarity is followed throughout.

Caution: When using the Al8-TC variant, if sensor break is enabled on a channel (i.e. in the CODESYS software, in the module's Module Configuration tab, the Break Response parameter for a channel is set to Detect Only), do not connect more than one input to a single source (thermocouple or mV) since this may compromise the measurement and sensor break action.

Also, it is not recommended to connect additional instruments to a single input source.

Status indicators

As shown in the Figure 22 below, the Al8 module's status is shown by a single green LED, whilst the status of each individual channel is shown by a red LED.

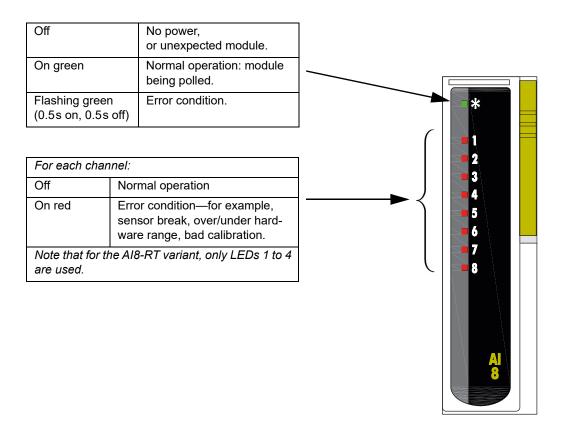

Figure 22: Al8 module status

2.3.8 Two-channel analogue output (AO2)

This module provides two isolated output channels which can be configured independently (in software) as voltage or current source outputs. The specified voltage output range (0 to 10V) can be expanded slightly (-0.3V to +10.3V) by limiting the load to a minimum value of 1500 Ω . Figure 23 gives the module pinout.

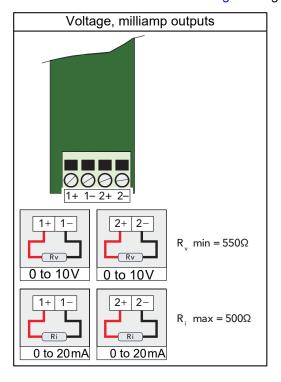

Figure 23: AO2 module pinout

Note: The module terminals accept wire sizes from 0.20 to 2.5mm² (14 to 24AWG). The screws should be tightened to 0.4Nm (5.3lbin) using a 3.5mm flat blade screwdriver.

Status Indicators

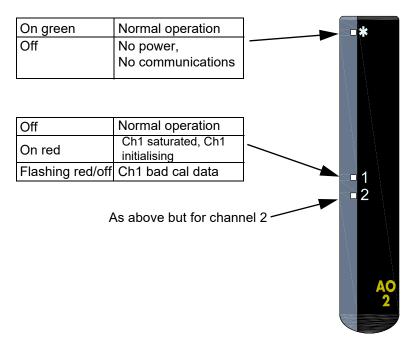

Figure 24: AO2 module status indicators

Note: Flashing = 0.5s on, 0.5s off.

2.3.9 Six-channel digital input module (DI6)

This module provides six isolated ac logic input circuits. The module is available in two versions, one suitable for nominal 230 V RMS, the other for nominal 115 V RMS. It is not possible for the user to convert one DI6 version to the other.

Caution: Using the 115V version with 230V inputs causes power consumption higher than specified, which can lead to overheating and eventual failure.
 Using the 230V version with 115V inputs may cause intermittent switching as 115V lies outside both the off and the on switching voltage ranges

Status Indicators

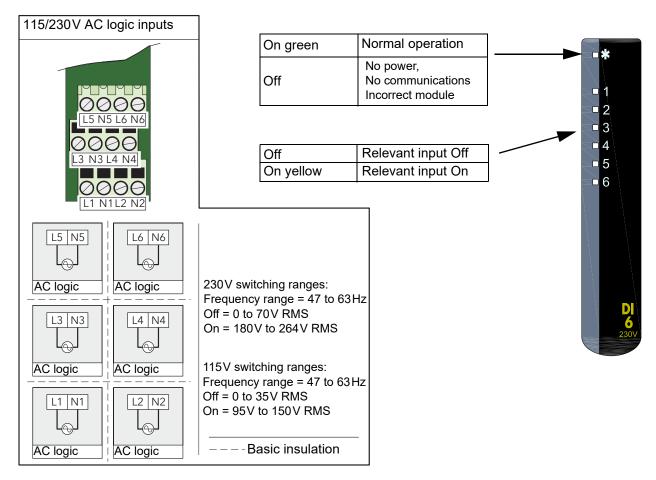

Figure 25: DI6 module pinout & status indicators (230V version shown; 115V version similar)

2.3.10 16-Channel digital output module (DO16)

This module provides 16 digital outputs of up to 700mA each. Two sets of power supply inputs are included, with the 'C' terminals being internally connected. The 'P' terminals are not internally connected.

Caution: If the module is inserted into a powered base unit, the outputs might turn on fleetingly (up to 8ms). The module should not be inserted into a powered base unit where such fleeting outputs could be damaging to the process being controlled, unless the wiring has first been disconnected.

Note: Any 'plant-side' power supply connected to a DO16 module must be capable of supplying an inrush current of 30A for 100 µs.

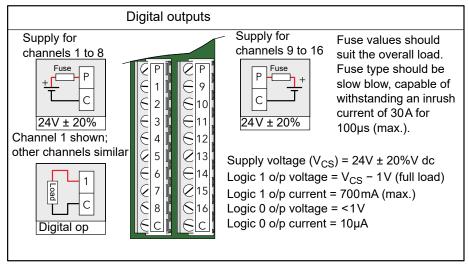

Figure 26: DO16 module pinout

In the CODESYS software, you can configure DO16 channels to operate as the following types: On/Off, Time Proportioned or Valve Positioner. Selecting the Valve Positioner type ties together a pair of adjacent outputs, with the positive part of the signal handled by the odd-numbered output, and the negative part of the signal handled by the even-numbered output.

Status indicators

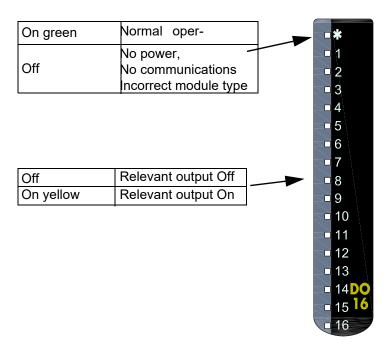

Figure 27: DO16 module status LEDs

2.3.11 16-Channel digital input module (DI16)

This module provides 16 digital inputs which support either logic inputs or contact closure inputs. Both input types may be freely mixed on each DI16 module.

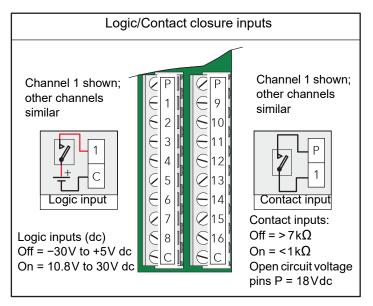

Figure 28: DI16 module pinout

Note: The 'P' terminals are internally connected together and the 'C' terminals are internally connected together.

The module terminals accept wire sizes from 0.20 to 2.5 mm² (14 to 24 AWG). The screws should be tightened to 0.4 Nm (5.3 lbin) using a 3.5 mm flat blade screwdriver.

Status Indicators

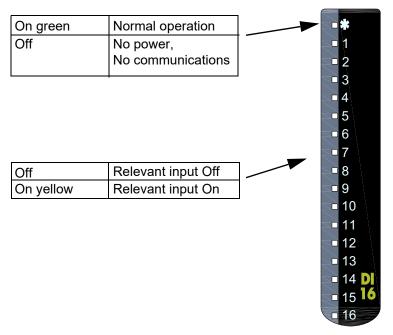

Figure 29: DI16 module status indicators

2.3.12 Eight output relay module (RLY8)

This module provides eight relay outputs with common/normally open contacts. No snubber circuitry is built into this module so it is the responsibility of the user to incorporate such circuit elements as are necessary to protect the relay contacts from undue wear, and to maintain CE compliance for the system.

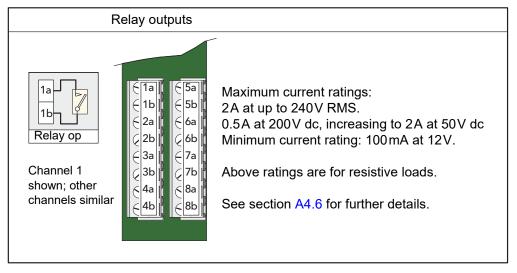

Figure 30: RLY8 module pinout

Note: The module terminals accept wire sizes from 0.20 to 2.5mm² (14 to 24AWG). The screws should be tightened to 0.4Nm (5.3lbin) using a 3.5mm flat blade screwdriver.

In the CODESYS software, you can configure RLY8 relay channels to operate as the following types: On/Off, Time Proportioned or Valve Positioner. Selecting the Valve Positioner type ties together a pair of adjacent relays, with the positive part of the output signal handled by the odd-numbered relay, and the negative part of the output signal handled by the even-numbered relay.

Status Indicators

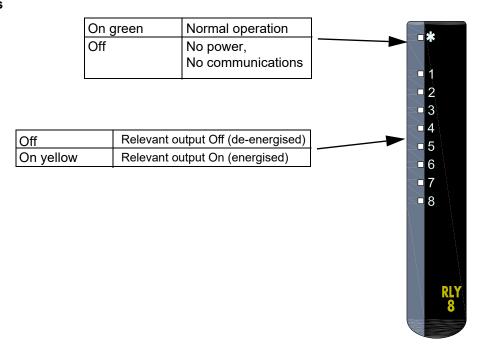

Figure 31: RLY8 status indicators

2.3.13 Zirconia input module (ZI)

This module consists of two input channels isolated both from each other and from the system electronics, used to measure the zirconia probe temperature (thermocouple input to channel one) and the zirconia probe output signal (channel two). The cold junction compensation for the thermocouple input is provided by a resistance temperature detector (RTD) mounted on the terminal unit.

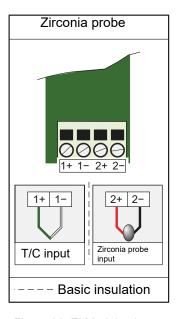

Figure 32: ZI Module pinout

Status indicators

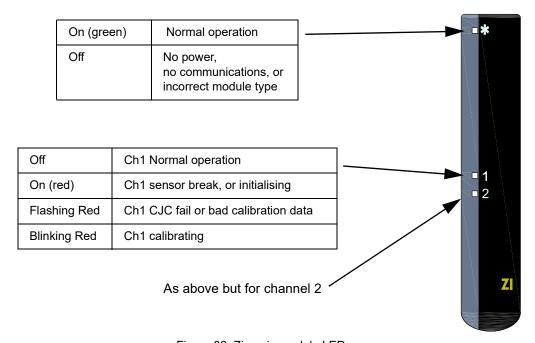

Figure 33: Zirconia module LEDs

Note: Flashing = 50 ms on, 50 ms off. Blinking = 0.2s on, 1.8s off.

3 CODESYS Software

The E+PLC400 is configured and monitored using the CODESYS Development System software, running on a Windows PC.

3.1 Accessing the CODESYS Online Help

The CODESYS software includes extensive online help.

A tutorial video on how to **Find further information and use HELP** is available on the Eurotherm web portal.

In the CODESYS Development System, select **View > Start Page** to display the portal in the main CODESYS window.

To launch the CODESYS help, click on its **Help** menu (figure 34):

Figure 34: Launching the CODESYS online help

The **Online Help** window is displayed (figure 35)

Figure 35: The CODESYS Online Help viewer

3.2 CODESYS Library Documentation

In addition to the CODESYS Online Help, CODESYS libraries include their own documentation, with detailed information on the POUs (Program Organization Units) in the library (such as functions and function blocks). You can view this in the CODESYS editor windows themselves, for instance in the **Library Manager** (figure 36).

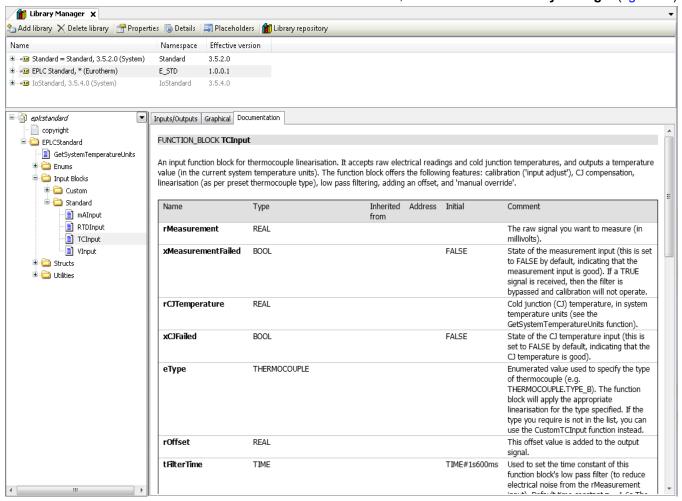

Figure 36: Viewing library documentation in the CODESYS Library Manager

A subset of the same information is also displayed in a tooltip when you hover over POU with the mouse. To display information on a POU in the Online Help window, select the POU and press **F1**.

3.3 'How to' tutorial videos and example projects

Eurotherm also provide a range of "How to" tutorial videos and example projects for the E+PLC400. These are available on a Eurotherm web portal. To launch the portal from within the CODESYS Development System, select **View > Start Page** from the menus (figure 37).

Note: To access the online tutorials, the PC running your CODESYS software must have Internet access.

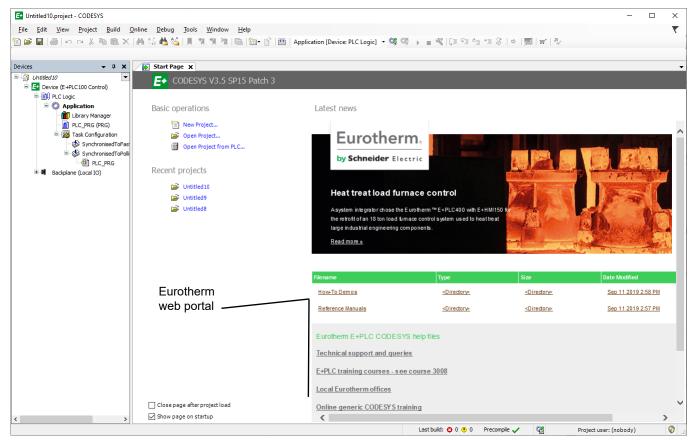

Figure 37: Accessing the Eurotherm web portal from within the CODESYS Development System

3.4 COMMUNICATING WITH THE E+PLC400

In order to set up communications between the CODESYS software and the E+PLC400, please refer to the section of the Eurotherm E+PLC help within CODESYS software called "*Initial connection & connecting to E+PLC400*".

For further information see;

See "Accessing the CODESYS Online Help" on page 46.

Appendix A: SPECIFICATION

A1 INSTALLATION CATEGORY AND POLLUTION DEGREE

This product has been designed to conform to BS EN61010-1 installation category II and pollution degree 2. These are defined as follows: INSTALLATION CATEGORY II

The rated impulse voltage for equipment on nominal 230V ac mains is 2500V.

POLLUTION DEGREE 2

Normally, only non-conductive pollution occurs. Occasionally, however, a temporary conductivity caused by condensation shall be expected.

A2 GENERAL SPECIFICATION

A2.1 Physical

Backplane dimensions: 0 module: 61mm wide x 180mm high x 132mm deep (2.41in x 7.1in x 5.2in)

4 module: 172.4mm wide × 180mm high × 132mm deep (6.79in × 7.1in x 5.2in)

8 module: 274mm wide \times 180mm high \times 132mm deep (10.8in \times 7.1in \times 5.2in)

16 module: 477mm wide × 180mm high × 132mm deep (18.8in × 7.1in x 5.2in)

Backplane fixing centres: 0 module: 26mm (1.023in)

4 module: 127.4mm (5.02in)

8 module: 127.4mm (5.02in)

16 module: 432.2mm (17.016in)

Weight: 0 module: 0.7kg (1.54lb). Including controller module

4 module: No modules = 0.7kg (1.54lb).

Including controller and 4 × I/O modules = 1.65kg (3.64lb) max

8 module: No modules = 0.98kg (2.16lb).

Including controller and $8 \times I/O$ modules = 3.1kg (6.83lb) max.

16 module: No modules = 1.6 kg (3.53 lb).

Including controller and 16 × I/O modules = 5.24 kg (11.55 lb) max.

See figure 1 and figure 2 for dimensional details.

A2.2 Electrical

Protective earth ground conductor connections:

Earth terminal strip at lower front flange of base unit.

Supply voltage: 24Vdc (±20%)

Supply power (max.): 82 watts (16 module base)

Surge current (max.): 8 amps

Back-up supply: BR2450 3V lithium coin cell fitted inside backplane side panel (Figure 8).

Note: If the supply voltage falls below 19.2V dc during startup, the instrument can enter a continuous cycle of attempted re-starts.

A2.3 Environmental

Temperature: Storage: −20 to +85 °C

Operation: 0 to + 55 °C

Humidity: Storage/Operation: 5 to 95% RH (dew-point 50 °C) (See figure 38).

Atmosphere: Non-corrosive, non-explosive.

Altitude (max.): 2000 m

Environmental protection: Panel: BS EN60529:IP20

RFI: BS EN61326-1:2006 Class A

EMC immunity: BS EN61326-1:2006 Industrial locations.

Electrical Safety Specification: BS EN61010-1: 2001 (see section A1, above); UL61010-1.

Vibration: BS EN61131-2 (9 to 150 Hz @ 1g; 1 octave per minute).

Shock: Impact withstand: BS-EN61131-2 (Corner drop test 100 mm)

Packaging: BS EN61131-2

Free fall: BS EN60068-2-32, proc. 1 (five × 1 metre drops for each of six faces).

Flammability of plastic materials UL746 UL V0

RoHS compliance EU; China

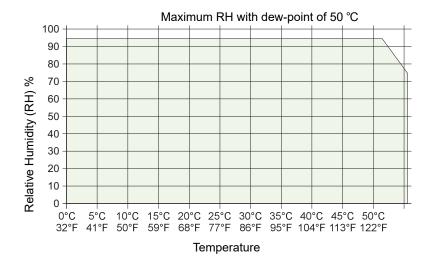

Figure 38: E+PLC400 Humidity tolerance

A2.4 Approvals

CE; cUL (UL61010-1), file number E57766; GOST CUTR

A2.5 Ethernet Communications

Connectors: RJ45 connector located on the controller module.

Network medium: Ethernet Category 5 cables.

Protocols: Modbus-TCP RTU slave, FTP.

Speed: 100Mbps.

Network Topology: Star connection to a hub.

Line length (max): 100 metres, extendible by repeater.

Allocation of IP address: Manual or DHCP.

Isolation: 50Vdc; 30Vac. (IEEE 802.3)

A2.6 Modbus Communications

Connector: Parallel pair of RJ45 connectors on the Controller module terminal unit.

Network medium: EIA485, link selectable as 3-wire or 5-wire.

Protocols: MODBUS RTU master and slave.

Isolation: None.

A2.6.1 Setting up projects for Modbus (Phase 4 onwards)

Note: To enable Modbus slave communications on an E+PLC device, you must uncomment the line:

pass in on motetsec0 proto tcp from any to any port = 502 In the firewall configuration file which can be found on the device's filesystem at /Firewall/fw4.cfg and can be restricted to specific IP or MAC addresses. Changes to the firewall will not take effect until the instrument is power-cycled.

A3 CONTROLLER MODULE SPECIFICATION

A3.1 TERMINAL UNIT

A3.1.1 Physical

Dimensions (approx.): 50mm wide × 110mm high

Weight (approx.): 0.1kg

A3.1.2 Setup Switch

SW2, segment 1: Watchdog retry (trip and try again mode)

All other switches are reserved

A3.1.3 Link

LK1 and LK2: Link pins 1 and 2 for three-wire communications; link pins 2 and 3 for five-wire (see figure 8).

A3.1.4 User Connectors

Supply power: Four-way terminal block for supply power. Supply separately monitored by the Controller module.

Watchdog Relay: Two × three-way terminal block.

Backup battery: Shares connectors with Watchdog relays.

Modbus: Two RJ45 sockets, wired in parallel.

USB: Type A connector.

A3.1.5 USB

Connector type: Type A located on controller terminal unit (Figure 8)

USB standard: USB 2.0 host communications.

Source current: 500mA max (current limited).

Fuse: Within controller module. Non-user replaceable.

A3.2 CONTROLLER MODULE HARDWARE

A3.2.1 General

Dimensions: 25mm wide × 114.3mm high × 110mm deep

Flash memory: 128MByte

File system Maximum supported filename length is 125 Unicode (UCS16) characters

A3.2.2 LED Indicators

Power status (24V dc nom — Main supply)

Fault indicator

Battery status

Serial Communications status

Ethernet IP resolution status

PLC program run status

USB software status

USB hardware status

Ethernet speed

Ethernet activity

See Section 2.3.3 for details of all controller module LEDs

A3.2.3 User Connections

Ethernet Communications: RJ45 connector mounted on the underside of the controller unit.

A3.2.4 Removable Storage

Memory card: SDHC 32MBytes

A4 I/O MODULE SPECIFICATIONS

Accuracy of analogue I/O is quoted based on the ex-factory calibration. For the E+PLC400, calibration can be improved using the software calibration functionality in the EPLC Standard library's input blocks. For details refer to the CODESYS Online Help (see section 3.1).

A4.1 AI2 MODULE

General specification, common to all variants:

Power consumption: 2W max.

Common mode rejection (47 to 63 Hz): > 120dB

Series mode rejection (47 to 63 Hz): > 60dB

Isolation (channel to channel): 300 V RMS or dc (basic insulation).

Isolation (to system): 300 V RMS or dc (double insulation).

Max voltage across any channel: 10.3V dc

A4.1.1 Thermocouple input variant, Al2-TC

mV inputs, Thermocouple inputs

Input range: -150mV to +150mV

 Input impedance:
 > 100MΩ (sensor break detect circuit 'Off')

 Input leakage current:
 < 100nA (sensor break detect circuit 'Off')

 mV calibration accuracy:
 $\pm 0.1\%$ of input value, max. offset $\pm 10 \mu V$

Noise: $< 28\mu V p-p$ with filter off: $< 4\mu V p-p$ with $\tau = 1.6$ s filter (better with longer time constants).

Resolution: Better than $2\mu V$ with $\tau = 1.6$ second filter.

Linearity: Better than 5 µV

Temperature coefficient: < 40ppm of reading per °C

Sensor break protection: Switchable as 'High', 'low' or 'Off'. Sensor current: 125nA

Cold Junction

Temperature range: −10 °C to +70 °C

CJ Rejection: >30:1

CJ accuracy: ± 0.5 °C typical (max. offset ± 1.0 °C)

Sensor type: Pt100 RTD, located beneath the input connector

High impedance input (channel two only)

Input range: 0.0V to 1.8V

 Input impedance:
 > 100MΩ (sensor break detect circuit 'Off')

 Input leakage current:
 < 100nA (sensor break detect circuit 'Off')</td>

 Calibration accuracy:
 \pm 0.1% of input value, max. offset \pm 20μV

Noise: $<100\mu\text{V p-p}$ with filter off: $<15\mu\text{V p-p}$ with τ =1.6s filter (better with longer time constants).

Resolution: Better than $7\mu V$ with $\tau = 1.6$ second filter

Linearity: Better than $50 \mu V$

Temperature coefficient: <40ppm of reading per °C

A4.1.2 DC input variant, Al2-DC

mV inputs

Input range: -150mV to +150mV

 Input impedance:
 >100MΩ (sensor break detect circuit 'Off')

 Input leakage current:
 <100nA (sensor break detect circuit 'Off')</td>

 Calibration accuracy:
 $\pm 0.1\%$ of input value, max offset $\pm 10 \mu V$

Noise: $<28\mu V p-p$ with filter off: $<4\mu V p-p$ with τ =1.6s filter (better with longer time constants).

Resolution: Better than $2\mu V$ with $\tau = 1.6$ second filter

Linearity: Better than 5µV

Temperature coefficient: <40 ppm of reading per °C

Sensor break protection: Switchable as 'High', 'low' or 'Off'. Sensor current: 125nA

High impedance input (channel two only)

Input range: 0.0V to 1.8V

 $\begin{tabular}{ll} \textbf{Input impedance:} &> 100 M\Omega \ (sensor break detect circuit 'Off') \\ \begin{tabular}{ll} \textbf{Input leakage current:} &< 100 nA \ (sensor break detect circuit 'Off') \\ \begin{tabular}{ll} \textbf{Calibration accuracy:} & \pm 0.1\% \ of input value, max. offset $\pm 20 \,\mu\text{V}$ \\ \end{tabular}$

Noise: $<100\mu V p-p$ with filter off: $<15\mu V p-p$ with $\tau=1.6$ s filter (better with longer time constants).

Resolution: Better than $7\mu V$ with $\tau = 1.6$ second filter.

Linearity: Better than 50 µV

Temperature coefficient: <40 ppm of reading per °C

Voltage inputs

Input range: -10.3V to +10.3V

Input impedance: $303\,\text{k}\Omega$

Calibration accuracy: ±0.1% of input value, max offset ±2mV

Noise: <2mV p-p with filter off: <0.4mV p-p with τ =1.6 s filter (better with longer time constants).

Resolution: Better than 0.2 mV with τ = 1.6 second filter.

Linearity: Better than 0.7 mV

Temperature coefficient: <40 ppm of reading per °C

Resistance inputs

Input range: 0Ω to 560Ω , covering -200°C to +850°C with Pt100 sensors

Connection Options Supports 2-wire, 3-wire, or 4-wire sensor connections

Lead Resistance 22 Ω maximum each lead (total resistance to be within range limits)

Sensor Current 320µA maximum

Calibration accuracy: $\pm 0.1\%$ of measured value, $\pm 0.1\Omega$

Noise: $< 0.08\Omega \text{ p-p}$ with $\tau = 1.6 \text{ s}$ filter (better with longer time constants).

Resolution: <0.04 Ω with τ =1.6 second filter.

Linearity: Better than 0.05Ω

Temperature coefficient: <30 ppm of reading per °C

High Resistance input

Input range: 0 to $6k\Omega$

Connection Options: Supports 2-wire, 3-wire, or 4-wire sensor connections

Lead Resistance: 22Ω maximum each lead (total resistance to be within range limits)

Sensor Current: 320µA maximum

Calibration accuracy: $\pm 0.1\%$ of measured value, $\pm 0.6\Omega$

Noise: $< 0.5\Omega$ p-p with $\tau = 1.6$ s filter (better with longer time constants).

Resolution: <0.25 Ω with τ =1.6 second filter.

Linearity: Better than 0.1Ω

Temperature coefficient: <30 ppm of reading per °C

Potentiometer inputs

Input range: 0 to 100% rotation

End-to-end resistance: 100Ω (min.) to $6k\Omega$ (max.)

Drive Current: 310µA maximum

 $\textbf{Calibration accuracy:} \qquad \qquad \pm 0.1\% \text{ of rotation value, } \pm 0.1\%$

Noise: < 0.3% p-p with $\tau = 1.6$ s filter 100Ω pot (better with larger resistance)

Resolution: Better than 0.001% with 1.6 second filter and $5k\Omega$ pot.

Linearity: Better than 0.01%

Temperature coefficient: <20ppm of reading per °C

A4.1.3 mA input variant, Al2-MA

4 to 20 mA loop inputs

Input range: -25mA to +25mA with 5Ω burden resistor in terminal unit.

Calibration accuracy: ± 0.25% of input value, max. offset ±5µA

Noise: $<1\mu A p-p$ with $\tau = 1.6 s$ filter (better with longer time constants).

Resolution: Better than $0.5\mu A$ with $\tau = 1.6$ second filter

Linearity: Better than 1µA

Temperature coefficient: <50ppm of reading per °C

A4.2 AI3 MODULE

A4.2.1 General specification

Power consumption (Current i/p): 2.2W

Power consumption (Three powered loops): 1.5W max.

Common mode rejection (47 to 63 Hz): >120 dB

Series mode rejection (47 to 63 Hz): >60 dB

Isolation (Channel to channel):50 V RMS or dc (basic insulation).Isolation (to system):300 V RMS or dc (double insulation).

A4.2.2 Hart Compliance

Cutting printed circuit links (one per channel) on the underside of the terminal unit places 195 \Omega resistors in the input circuits within the Al3 module (section 2.3.5).

A4.2.3 Channel inputs

Input range: -28 mA to +28 mA

 $\textbf{Calibration accuracy:} \qquad \qquad \pm 0.1\% \text{ of input value, max. offset } \pm 20\,\mu\text{A}$

Noise: $<1\mu A p-p$ with $\tau = 1.6 s$ filter (better with longer time constants)

 $\label{eq:Resolution:Better than 0.5 μA with τ=1.6 second filter.}$

Linearity: Better than 1µA

Temperature coefficient: <50 ppm of reading per °C

Burden resistor: 60Ω nominal; 50mA maximum currentChannel PSU:22V (min at 21mA) to 30V (max) at 4mAPSU protection:30 mA (nom) current trip, auto resetting.

A4.3 AI4 MODULE

General specification (applies to all Al4 variants)

Power consumption: 2W max.

Common mode rejection (47 to 63Hz): >120dB

Series mode rejection (47 to 63Hz): >60dB

Isolation (Channel 1 to channel 2): No isolation

Isolation (Channel 3 to channel 4): No isolation

Isolation (Ch1 or Ch2 to Ch3 or Ch4): 300V RMS or dc (basic insulation).

Isolation (to system): 300 V RMS or dc (double isolation).

Max. voltage across any channel: 5V dc

A4.3.1 Thermocouple input variant

Thermocouple inputs

Input range: -150 mV to +150 mV

Input impedance: $>20M\Omega$ Input leakage current: <125nA

 $\begin{tabular}{ll} \textbf{Calibration accuracy:} & \pm 0.1\% \ of \ input \ value, \ max. \ offset \ \pm 10 \mu V \\ \end{tabular}$

Noise: $<4\mu V p-p \text{ with } \tau=1.6 \text{ s filter (better with longer time constants)}.$

Resolution: Better than $2\mu V$ with $\tau = 1.6$ second filter.

Linearity: Better than $5\mu V$

Temperature coefficient: <40ppm of reading per °C

Sensor break protection: Fixed pull-up. Sensor current: 125nA

Cold Junction

Temperature range: −10 °C to +70 °C

CJ rejection: >30:1

CJ accuracy: ±0.5 °C typical, max. offset ±1 °C

Sensor type: Pt100 RTD, located beneath the input connector.

A4.3.2 mV input variant

Input range: -150 mV to +150 mV

 $\begin{tabular}{ll} \textbf{Input impedance:} &>20\,M\Omega \ (sensor break detect circuit 'Off') \\ \begin{tabular}{ll} \textbf{Input leakage current:} &<125\,nA \ (sensor break detect circuit 'Off') \\ \end{tabular}$

 $\begin{tabular}{ll} \textbf{Calibration accuracy:} & \pm 0.1\% \ of \ measured \ value \ \pm \ 10 \ \mu V \end{tabular}$

Noise: $<4\mu V p-p$ with $\tau = 1.6 s$ filter (better with longer time constants).

Resolution: Better than $2\mu V$ with $\tau = 1.6$ second filter.

Linearity: Better than 5 µV

Temperature coefficient: <40 ppm of reading per °C

A4.3.3 mA input variant

Input range: -25mA to +25mA

 $\begin{tabular}{ll} \textbf{Calibration accuracy:} & \pm 0.25\% \ of input value, max. \ offset \pm 0.5 \mu A \end{tabular}$

Noise: $<1\mu A p-p$ with $\tau=1.6 s$ filter (better with longer time constants).

 $\label{eq:Resolution:Better than 0.5 μA with τ = 1.6 second filter.}$

Linearity: Better than 1µA

Temperature coefficient: <50ppm of reading per °C

Burden resistor: $5\Omega \pm 1\%$ (fitted to terminal unit)

A4.4 **AI8 MODULE**

General specification (applies to all Al8 variants)

Number of channels: 8 (4 for RTD)

< 1.8W Module power consumption:

Common mode rejection (47 to 63Hz)

w.r.t. system, i.e. across galvanic isolation:

> 140dB

> 60dB Series mode rejection (47 to 63 Hz):

Isolation to system: Reinforced for < 300 V ac/dc mains networks—Installation category II

Isolation between channels: Galvanic isolation in pairs. Basic isolation for < 300 V ac/dc mains networks—Installation category II

Differential isolation within ±1V range between the two channels of each pair in thermocouple, mV and mA mod-

ules. RTD provides basic isolation (< 300 V ac/dc) between channels.

A4.4.1 Thermocouple input variant

Thermocouple inputs

Suitable thermocouples: B, C, D, E, G2, J, K, L, N, R, S, T, U, NiMo/NiCo, Platinel, Ni/NiMo, Pt20%Rh/Pt40%Rh

-80 mV to +80 mV Input range:

Input impedance: $10M\Omega$ differential, $2.5M\Omega$ common

Input leakage current: < ±25nA (@ < 1V common)

Calibration accuracy: ± 0.1% of reading above 10% of range (at 25°C ambient temperature)

DC common mode rejection (w.r.t. other channels of the same pair):

> 105dB for source impedance mismatch < 100Ω

Resolution/Noise (at 110ms update rate): > 17 bits of span with τ =1.6s filter (±1.5 μ V); 16 bit of span with no filter (±3 μ V)

Linearity: ±0.1 °C (deviation from defined curves)

Sensor break detection: within 250ms using $25\mu A$ pulse. Thresholds equivalent to $50k\Omega$ (high).

Cold Junction

CJ Rejection: > 30:1 minimum ±0.8 °C typical Internal CJ accuracy:

A4.4.2 mV input variant

Suitable transmitter types: mV sources with output impedance > $1k\Omega$ (floating or grounded)

-80mV to +80mV Input range:

Input impedance: $10M\Omega$ differential, $2.5M\Omega$ common

Input leakage current: < ±25nA (@ < 1V common)

Calibration accuracy: ± 0.1% of reading above 10% of range (at 25°C ambient temperature)

DC common mode rejection (w.r.t. other

channels of the same pair):

> 105dB for source impedance mismatch < 100Ω

Resolution/Noise: > 17 bit with τ =1.6s filter (±1.5 μ V); 16 bit of span with no filter (±3 μ V)

Linearity: 10 ppm of span Temperature coefficient: < ±30 ppm per °C

Zero offset: $< \pm 3 \mu V$

Offset drift: < 20pV per °C

Sensor break detection: within 250 ms using 25 μA pulse. Thresholds equivalent to 50 kΩ (high).

A4.4.3 mA input variant

Suitable transmitter types: 4 to 20mA sensors (floating or grounded)

 $-20\,\text{mA}$ to $+20\,\text{mA}$ with $3.33\,\Omega$ burden resistor fitted in the terminal unit. Input range:

Input impedance: $10M\Omega$ differential, $2.5M\Omega$ common

Calibration accuracy: ± 0.15% of reading above 10% of range (at 25°C ambient temperature)

DC common mode rejection (w.r.t. other channels of the same pair):

> 105dB for source impedance mismatch < 100 Ω

Resolution/Noise: > 17 bit with τ =1.6s filter (±0.5 $\mu V);$ 16 bit of span with no filter (±1.0 $\mu V)$

Linearity: 20ppm of span

< ±40ppm per °C (using 10ppm shunt resistor) Temperature coefficient:

Zero offset:

Offset drift: < ±8pA per °C

Sensor break detection: Not detectable in hardware (software can detect under range current)

RTD input variant A4.4.4

Number of channels

Pt100, Pt1000 Suitable RTD types:

Input ranges: 0Ω to 500Ω and 0Ω to $5k\Omega$

Calibration accuracy: ± 0.1% of resistance reading above 10% of range (at 25°C ambient temperature).

Resolution/Noise: >17 bit ($\pm 8m\Omega$) (with τ =1.6s filter); 16 bit ($\pm 16m\Omega$) with no filter

Linearity: 20ppm of span Temperature coefficient: < ±20ppm per °C

Sensor break detection: within 125ms by high resistance detection

A4.5 AO2 MODULE

A4.5.1 General specification

Power consumption: 2.2W max.

Isolation (Channel to channel):300 V RMS or dc (basic insulation).Isolation (to system):300 V RMS or dc (double insulation).

A4.5.2 Current outputs

Output range: -0.1 to +20.5 mA

Load limits: 0 to 500Ω

Calibration accuracy: Better than ±0.1% of reading, max. offset ±20µA

Linearity: 0.03% range $(0.7\mu\text{A})$

Resolution: Better than $0.5\mu A$ with $\tau = 1.6$ second filter.

A4.5.3 Voltage outputs

Output load limit (-0.1 to +10.1 V range): 550Ω min. Output load limit (-0.3 V to +10.3 V range): 1500Ω min.

Calibration accuracy: Better than 0.1% of reading, max. offset ±10mV

Linearity: 0.03% range (0.3mV)

Resolution: Better than 1 part in 10,000 (0.5mV typical)

A4.6 DI6 MODULE

Note: This module is ordered either as a 115V version or as a 230V version. One type cannot be converted into the other.

Each input is fitted with a 470 pF capacitor for EMC purposes. This causes an earth leakage current of approximately 0.04 mA at 115 V ac 60 Hz or 0.08 mA 230 V ac 60 Hz.

General specification

Power consumption: 0.5W max.

Detectable pulse width: Three mains cycles

Isolation (Channel to system): 300V RMS or dc (Double insulation)
Isolation (Channel to channel): 300V RMS or dc (Basic insulation)

A4.6.1 115V ac input variant: 115V inputst

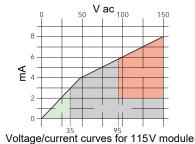

Off (logic 0) voltage: 0 to 35 V ac.

On (logic 1) voltage: 95 V to 150 V ac

Maximum input current: 8 mA at 150 V RMS

Minimum input current: 2mA

Max. voltage across any channel: 150 V RMS

Note: The result of applying RMS voltages between 35V and 95V is not defined.

A4.6.2 230 V ac input variant: 230 V inputs

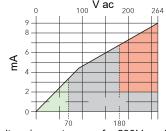

Off (logic 0) voltage: 0 to 70 V ac.

On (logic 1) voltage: 180 V to 264 V ac

Maximum input current: 9mA at 264V RMS

Minimum input current: 2mA

Max. voltage across any channel: 264V RMS

Voltage/current curves for 230V module

Note: The result of applying RMS voltages between 70 V and 180 V is not defined.

A4.7 DI 16 MODULE

A4.7.1 General specification

Power consumption (logic mode): 0.75W max.

Power consumption (contact mode): 2.0W max.

Isolation (Channel to system): 300 V RMS or dc (Double insulation).

Isolation (Channel to channel): Channels share 'common' ('C') connections.

Minimum pulse width: 78.125ms

Max. voltage across any channel: 30 V dc

A4.7.2 Logic inputs

Off (logic 0) voltage: -30 V to +5 V dc
On (logic 1) voltage: 10.8 V to 30 V dc

Input current: 3.8mA approx. at 12Vdc; 2.8mA approx. at 24Vdc.

A4.7.3 Contact inputs

Off (logic 0) resistance: $>7 \, k\Omega$ On (logic 1) resistance: $<1 k\Omega$ Wetting current: $4 \, mA$ min.

Module internal isolated power supply (terminal P voltage):

(terminal P voltage): 16 to 18 V dc

Wetting voltage (effective): 12V dc min.

A4.8 DO16 MODULE

Note: Refer to section 2.3.10 for precautions to be taken when fitting DO16 modules

A4.8.1 General specification

Max. Power consumption (Module): 0.6W

Max. Power consumption (plant side): 850W

Isolation (Channel to system): 300 V RMS or dc (Double insulation).

Isolation (Channel to channel): Channels share 'common' ('C') connections.

A4.8.2 Output specification

Voltage supply (V_{CS}): 24Vdc ±20%

Logic 1 output voltage: (V_{CS} – 1)V for a full load.

Logic 0 output voltage: <1V

Logic 1 output current: 0.7A max. per channel.

Logic 0 output current: 10 µA

Short circuit protection: 0.7 to 1.7A per channel

Module thermal cut-off (55 °C ambient): 90 ± 3 °C (restart at 88 ± 3 °C)

A4.9 RLY8 MODULE

Note: Each input is fitted with a 100pF capacitor for EMC purposes. For each relay, this causes an earth leakage current of approximately 0.02mA at 240Vac 60 Hz.

A4.9.1 General specification

Power consumption: 2.5W max.

 Isolation (Channel to system):
 300 V RMS or dc (Double insulation).

 Isolation (Channel to channel):
 300 V RMS or dc (Basic insulation).

Contact life (resistive load) 240 Vac, 2A: $>6 \times 10^5$ operations

Contact life (resistive load) 240 Vac, 1A: $>10^7$ operations

Contact life (inductive load)

As per derating curves

Mechanical life: >3×10⁷ operations

A4.9.2 Relay specification

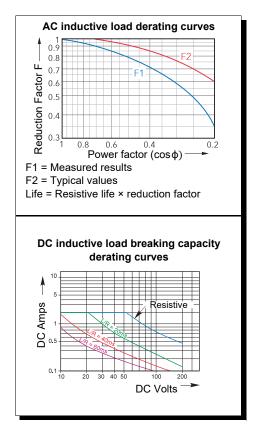

Contact material: AgCdO

Contact format: Common and normally open contacts. (Open circuit with relay not energised).

Maximum current rating (ac input): 2A at up to 240 Vac

Maximum current rating (dc input): 2A at 50 Vdc decreasing linearly to 0.5A at 200 V dc

Minimum current rating: 100mA at 12V

A4.10 ZI Zirconia Input Module

A4.10.1 General specification

Power consumption: 1.8W max

Common mode rejection: >80 dB (48 to 62 Hz)

Series mode rejection: >60 dB (48 to 62 Hz)

 Isolation (ZI Channel to TC channel):
 300V RMS or dc (Basic insulation).

 Isolation (Channel to system):
 300V RMS or dc (Double insulation).

Max. voltage across any channel: 10 V dc

A4.10.2 Thermocouple input (channel 1)

Input range: -77 mV to +100 mV

Input impedance: $10M\Omega$

Calibration accuracy: $\pm 0.1\%$ of reading $\pm 10 \mu V$

Noise: $<5\mu V$ peak-to-peak with τ =1.6 s filter.

Resolution: Better than $2\mu V$ with τ =1.6s filter.

Linearity: ±0.1 °C

Temperature coefficient: <±30 ppm/ °C

Sensor break protection: 250nA break high, low or off

Cold Junction

Temperature range: −10 °C to +70 °C

CJ rejection: >30:1

CJ accuracy: ± 0.5 °C (typical); ± 1.3 °C max. (automatic CJC)

Sensor type: Pt100 RTD, located beneath the input connector.

A4.10.3 Zirconia input (channel 2)

Input range: 0 mV to +1800 mV

Input impedance: $>500 M\Omega$

Calibration accuracy: ± 0.2% of input

Noise: < 0.1 mV peak-to-peak with τ = 1.6 s filter.

Resolution: $< 50 \,\mu\text{V}$ with $\tau = 1.6 \,\text{s}$ filter.

Sensor impedance measurement: $0.1\,k\Omega$ to $100\,k\Omega$ ±2%

Input leakage current: ±1 nA (typical) ±4 nA (max.)

Appendix B: E+PLC400 Battery Replacement Procedure

Personnel	One engineer, who shall be a suitably qualified person.		
Time required to complete	10 minutes.		
Parts required	Battery board (contains battery, soldered onto the board) Order Code E+PLC400SPARES/ACCESS/XX/XX/XX/BATT/XX For sales contacts see www.eurotherm.com/global		
Tools required	Magnetized Pozidrive #1 Screwdriver		
When to carry out	If the controller module battery LED (labelled with an $^{\perp}$ icon) goes out, or every 12 months, whichever is sooner.		

The E+PLC400 contains a 3V 'coin-cell' style battery, mounted on small board, fitted on the inside of the plastic side panel adjacent to the controller module.

The purpose of the battery is to maintain the contents of the controller module terminal unit's volatile memory when the E+PLC400 is powered off. This memory stores various parameters including the unit's serial number.

Note: The E+PLC400 can be left powered up while the battery is being replaced. This ensures the volatile memory contents will be retained.

The battery is soldered to its board, and the two are replaced as a single unit. Proceed as follows:

- 1. Open the hinged plastic front cover of the E+PLC400, so that the terminal units can be seen.
- 2. Locate the back of battery board (Figure 39): It is on the inside of the plastic side panel to the left of the controller module, and is fixed in place by two screws. A two-wire cable runs from the front of the battery board to the controller module terminal unit; the red wire connects to the B+ terminal, the black wire connects to the B- terminal. Eurotherm recommends leaving these wires connected to the terminals whilst replacing the battery.

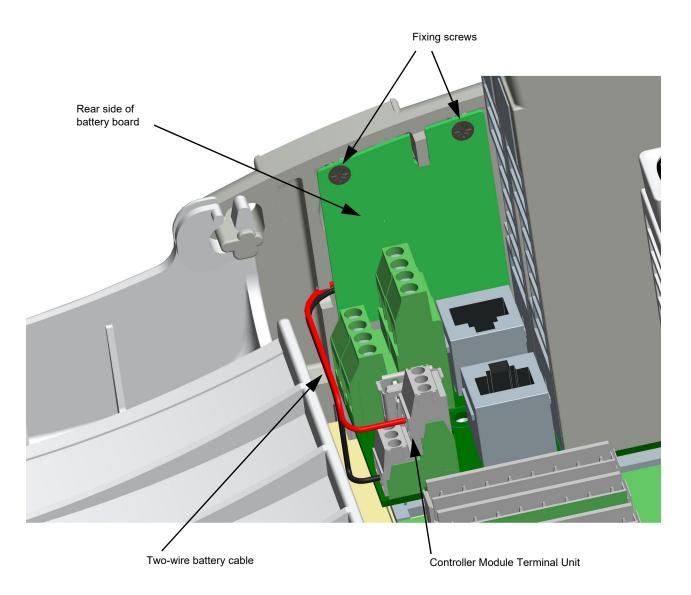

Figure 39: Battery board in place

- 3. Using a magnetized Pozidrive #1 screwdriver, unscrew the two fixing screws holding the battery board in place.
- 4. Carefully manoeuvre the battery board out from the plastic side panel. Unplug the two-wire cable from the board end (Figure 40)..

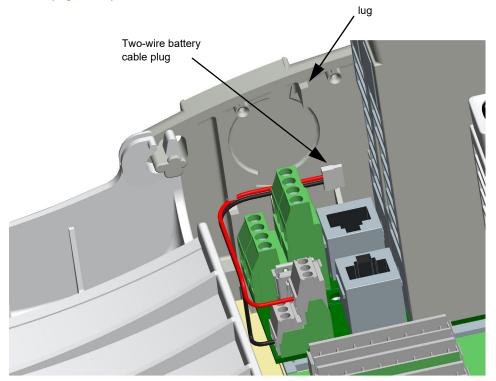

Figure 40: Battery board removed

Warning: Do not touch the battery itself using metal pliers or tweezers, as this could cause a short circuit possibly resulting in an explosion of the battery.

Warning: If the E+PLC400 is powered off during the battery change procedure, ensure that the new battery is connected within one hour of disconnecting the old battery. If the battery is disconnected for longer than one hour, the content of the controller module memory is likely to be erased or corrupted.

5. Take the new battery board (Figure 41), and plug the two-wire battery cable into it. I

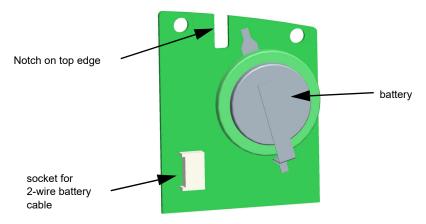

Figure 41: New battery board

- 6. Manoeuvre the new battery board into position in the left-hand plastic side panel. Note the lug on the panel which fits into the notch on the top end of the battery board.
- 7. Using a magnetized Pozidrive #1 screwdriver, screw in the two fixing screws to hold the battery board in place.
- 8. Close the plastic top cover of the E+PLC400.
- 9. Ensure the old battery board is disposed of appropriately.

Appendix C: E+HMI150 Panel Configuration

The E+HMI150 panels are intended for use with the E+PLC400 precision PLC. From time to time upgrades may be available, these may be downloaded from Eurotherm website, downloads.

For further information regarding configuration of the E+HMI150 panel see;

• E+HMI150 Panel Configuration Guide (HA032099)
