RELEASE HISTORY

Function Blocks

This is a revision history since Version 2.09.

Version 2.27.

Note: This was initially released as 2.26. Any versions of 2.26 in the field should be replaced with 2.27 as 2.26 contained an EPROM error. Only the EPROM has to be changed; the FB Library and applications can be used as they are.

The major change with this release was the introduction of "generic communications" where communication function blocks assigned to the ICM were executed on the ICM. The consequence is that from this version the ICM firmware version must match the LCM firmware version. Generic communications introduced BLOCK reads of J-Bus slave parameters.

The JBus Master, Siemens, Toshiba and the Statistical Blocks were included in the standard release rather than only on special order.

New Function Blocks.

Version 3.00

This revision introduced many new function blocks.

Used with the PS Version 3.04 and above, a context sensitive help was introduced defining the function of each pin of most of the function blocks.

The Comms and System classes were reversed in the listing (unintentionally). This changes some of the default addresses.

Extra pins were added to Task to indicate cpu utilisation.

Format characters were added to slave parameters. This ultimately caused significant problems using the default addresses with Wizcon. This problem has been resolved in version 3.1.

An 8 segment programmer was introduced together with a Filesystem which uses spare RAM to save recipes.

A new version of this EPROM was produced, dated 31 March 1995, which overcomes the failure to warm start when an application contains more than 80 JBus slave addresses.

NEWCLASS

Version 3.10

This version corrects some of the problems encountered in Version 3.00. The EI Bisync slave format character now works correctly.

A new remote instrument block was introduced and the old one removed. This new block prevents overload of the Master driver.

The Europanel function block was removed as this product is no longer available.

This function Block Library is available on the LCM-PLUS but it is a different EPROM!
