

# 6180 AeroDAQ

MODEL

## Secure Graphic Recorder for AMS2750D

### Specification Sheet

The 6180 AeroDAQ is designed to meet the specifications of the aerospace industry. Automated scheduling of TUS (Temperature Uniformity Survey), SAT (System Accuracy Test), and instrument calibration is handled by the AeroDAQ based on furnace class and instrument type as per the relevant tables of AMS2750D. A Service Page clearly displays the number of days until the next activity is due with messages to alert that the due date is approaching. Additionally, the AeroDAQ also monitors control thermocouple life for number of days used, and load thermocouples for both number of days used and number of uses. A pre-batch thermocouple life check will indicate the availability of the thermocouples for the next batch returning either OK or Will Fail with the reason (either days or uses will expire). Data is stored in a tamper-resistant binary format that can be used for secure, long term records of your process. The high accuracy, low drift input boards enable the AeroDAQ to meet the requirements of AMS2750D for Class 1 Furnace.

## Data logging and archiving

The AeroDAQ has internal Flash memory for secure data storage. They are also able to accept various removable media types (Compact Flash or USB memory stick). Data stored within the internal memory can be archived to the removable media on demand or at preset intervals. The AeroDAQ will give indication of how long its internal memory and that of the removable media installed will last according to the configuration of the recorder.

The AeroDAQ has Ethernet capability. It can be configured to archive to the removable media and/or over Ethernet. Archiving files over Ethernet effectively gives a secure, infinite archiving capacity.

Approximate duration for continuous recording of one group of six channels, high compression:

## Time synchronisation (SNTP)

The AeroDAQ supports Simple Network Time Protocol which, when enabled, updates the instrument time every 15 minutes from the configured SNTP server. The unit can also act as a Unicast SNTP server on the network, allowing client instruments to synchronise with the AeroDAQ to a resolution of one millisecond.

## Batch recording

Up to ten user-defined fields can be used to enter batch specific data.

Field descriptor	Operator entered batch information
– up to 20 characters	– up to 60 characters

The user can choose to log any number of the given fields on start and/or stop of a batch. The information will appear on the chart as a message and cannot be separated from the process data to which it relates.

## Audit trail

Standard on the AeroDAQ is a time stamped audit trail. This allows all actions taken on the recorder including all user logins, batch start and stop, TUS, SAT and calibration reset, and any configuration changes to be shown on the “chart” as well as becoming a permanent part of the history file. The audit trail information can be seen in historic views of the data.

## Modbus master

Allows users to view data from multiple instruments connected either by a local Network connection using Modbus TCP, or a Serial connection using Modbus RTU.

## ASCII printer output (reports)

Fitted as standard the ASCII text printer option provides the AeroDAQ with the ability to generate up to 10 simple reports that can be directed to a Serial ASCII text printer. Reports, triggered by an event/job can be configured to contain parameters such as time and date, batch names, process values and user defined messages.

## Dynamic Host Configuration Protocol (DHCP)

Dynamic Host Configuration Protocol, the successor to BootP, allows an AeroDAQ host to obtain Network parameters, such as IP address, Subnet Mask, default gateway and DNS server address dynamically. The implementation of DHCP on the AeroDAQ significantly reduces the overhead for maintaining a network of instrumentation.
